alpha Basic Line

PLANETARY GEARBOXES CP / CPS

The planetary gearboxes of the alpha Basic Line are the ideal choice for cost-oriented solutions. These gearboxes further increase design freedom in machines due to new additional output variants as well as five different sizes.

* CPS with replaceable B5 output flange

CP / CPS - Geared up to Fit

Tailored to applications in the mid-range and economy segment with low to medium requirements for positioning accuracy, the CP and CPS planetary gearboxes do not fail to impress. The key benefits offered by the gearboxes are high flexibility combined with maximum efficiency.

PRODUCT HIGHLIGHTS

High flexibility

Different output variants offer design freedom tailored to individual requirements. The flexibility on the input side also enables the realization of different motor mounting versions.

Maximum economy

The gearboxes of the alpha Basic Line are extremely economical to purchase and highly efficient in operation.

Fast sizing

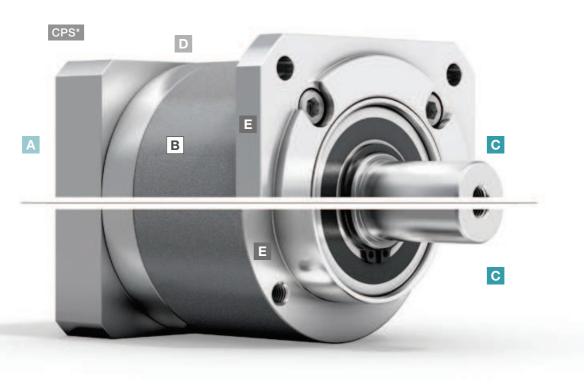

Efficient online sizing within seconds in the SIZING ASSISTANT on the basis of the application data or the motor.

CPS - planetary gearbox with long centering

CPS

* CPS with replaceable B5 output flange

Flexible motor connection

- Mounting of all common servo motors by means of a flexible and screw-fastened adapter plate
- Large number of motor shaft diameters connectable

Variety of sizes

- CP available in five different sizes (005 - 045)
- CPS available in three different sizes (015 - 035)

B High ratio variation

- Large number of ratios (i=3 to i=100)
- Available in the common binary ratios

Various output shapes

- With smooth shaft as well as shaft with key

Variable application connection

- Reduced installation space and maximum compactness thanks to a long centering
- Flange attachment for B5 mounting

^{a)} Valid for torque transmission only

b) Valid for standard clamping hub diameter

Palid for standard clamping has diameter.
 Refers to center of the output shaft or flange
 Please reduce input speed at higher ambient temperatures
 Valid for: Smooth shaft

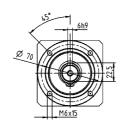

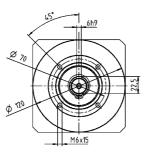

2-stage

up to 24 4) (G) 5) clamping hub diameter

clamping hub

Motor shaft diameter [mm]

up to 38 4) (K) diameter

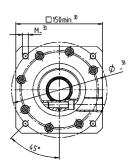

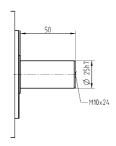

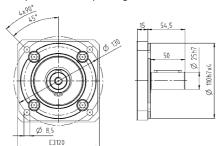

Other output variants

Smooth shaft

Replaceable B5 output flange

- Non-tolerated dimensions are nominal dimensions

 ¹⁾ Check motor shaft fit

 ²⁾ Min. / Max. permissible motor shaft length
 Longer motor shafts are possible, please contact alpha

 ³⁾ The dimensions depend on the motor

 ⁴⁾ Smaller motor shaft diameter is compensated
 by a bushing with a minimum thickness of 1 mm

 ⁵⁾ Standard clamping hub diameter

Value Linear Systems

System solutions count

The Value Linear Systems are adapted to linear applications in the Value Segment with comparatively low requirements in terms of smooth running, positioning accuracy, and feed force. The systems are typically used in woodworking machinery, plasma cutting systems, and automation.

High-end technology – the R-flange

The R-flange adapted from the Premium Segment allows greater design freedom in the Value Segment. The gearbox flange with integrated slots enables easy positioning of the gearbox with mounted pinion in relation to the rack. Cumbersome solutions with complicated designs featuring intermediate plates are therefore not required.

The alpha preferred Linear System

Our preferred Linear Systems in the Value Segment are the ideal combination of gearbox, pinion, rack, and lubrication system. The systems have been optimized to achieve the required feed force, feed speed, stiffness, and degree of utilization of the individual components. They cover a feed force range of up to 8,000 N. Feed speeds of up to 400 m/min are possible.

Refer to our alpha Linear Systems catalog and the website for more information on the Value, Advanced, and Premium Linear System. For a wide range of applications

alpha Linear Systems are suitable for a wide range of applications and industries. New standards are being set in the following areas:

- · Smooth running
- · Positioning accuracy
- · Feed force
- · Power density
- Rigidity
- · Ease of installation
- · Structural design
- · Scalability

Paired with a comprehensive range of services, we support you from the constructional draft to sizing, assembly, and commissioning. We will also ensure a consistent supply of spare parts.

The benefits of the alpha Linear Systems for you

- · Perfectly matched components
- · Maximum efficiency and power density
- Exceptional Linear System rigidity for even greater dynamics and precision
- · Simple mounting and perfect integration in the drive train
- · Available in different sizes, power categories, and segments

Consultation and quality – everything from a single source!

www.wittenstein-alpha.com/linear-systems

premo - servo actuators by WITTENSTEIN alpha

premo is the new, powerful servo actuator platform that combines absolute precision with perfect movement. The central idea behind this first fully scalable servo actuator platform is uncompromising flexibility from the viewpoint of the user: motors and gearboxes with application-related graduated performance characteristics can be configured modularly into individual servo actuators. The result is a highly versatile modular system with customizable power, designed for a wide range of applications. The core of the servo actuator is a torsionally rigid precision gearbox with low backlash and excellent torque density combined with the equally powerful, permanent magnet servo motor with an evenly distributed winding that guarantees low cogging and high speed constancy.

Typical areas of application and industry solutions

- · Delta robot (axes 1-3, swivel axis)
- · Handling gantry (Z-axis, swivel/rotating axis)
- · Machine tool milling (rotating axes A-C, tool changer)
- · Fill and seal machine (incl. jaw stroke, sealing jaw, blade)
- · Folding carton packaging (incl. assembly/folding, filling valve)
- · Plastic thermoform (tool axis)

premo application examples

premo PRODUCT HIGHLIGHTS

- · Optimized power density for greater energy efficiency and productivity
- · Flexible mechanical and electrical interfaces for high scalability
- · Individual upgrading of the basic configuration through a variety of options

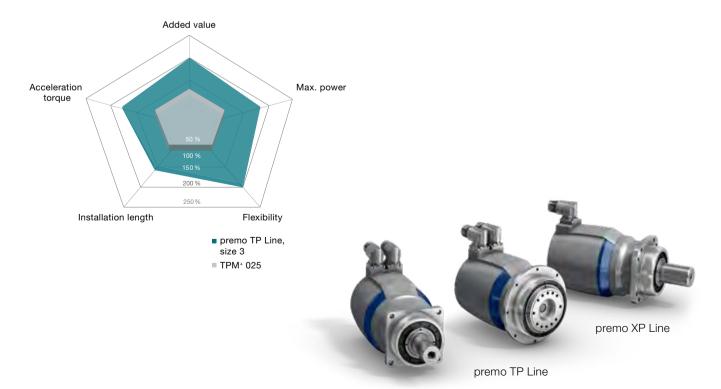

Handling gantry premo SP Line

Fill and seal machine premo TP Line

Milling head of a machining center premo XP Line

premo SP Line

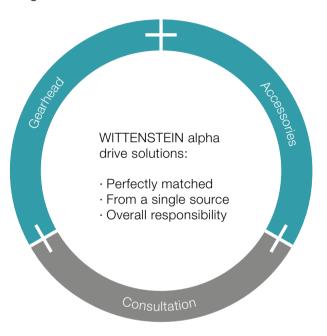

Accessories – smart addition of intelligent performance

In addition to gearboxes, servo actuators, and linear systems, we offer our customers an extensive portfolio of matching accessories.

Shrink discs and couplings are primarily used in the Basic and Value Line. Shrink discs are mainly used in applications with hollow shafts and couplings in shaft connections.

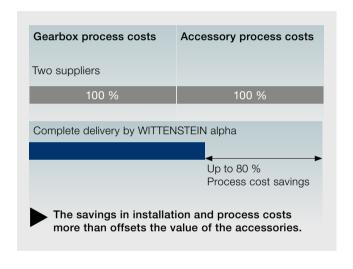

Perfectly match with the gearbox, they meet the expectations of customers.

Gearboxes, accessories, and consultation from a single source

Optimization of your value creation chain

Use the combination of gearboxes and accessories in a complete package to streamline your internal processes.

Shrink discs

Shrink discs are frictional hub-shaft connections. Together with our hollow shaft or blind hollow shaft gearboxes for direct mounting to load shafts, machine designs with a minimal installation space can be realized.

The benefits:

- · Simple assembly and disassembly
- · Corrosion-resistant stainless steel version
- · Maximum safety during the transmission of the emergency stop torques

0.0

Preferred shrink disc series

Provided it is possible to mount a shrink disc, you will find the matching shrink discs on the product page for your selected gearbox. To view more nickel-plated, stainless steel, and other shrink discs as well as all the relevant technical data and dimensions, visit our homepage

www.wittenstein-alpha.com

Couplings

Our innovative couplings, which are used in various drive technology sectors, ensure efficiency and process reliability in the applications.

Our couplings have the following properties:

- · Completely backlash-free torque transmission
- · Maintenance free
- · Durable
- · Compensation of shaft misalignments (axial, angular, lateral)

Metal bellows coupling

- · High torsional rigidity
- · Minimal reset forces
- · High true-running accuracy
- Corrosion resistant version available as an option (BC2, BC3, BCT)
- Large temperature range
 -30 °C to +300 °C
- Preferred coupling for alpha Advanced Line and alpha Premium Line

alpha Value

Torque limiter

- · Torque infinitely adjustable
- · Easy to assemble
- · Precise repeatability
- Precise, preset overload protection (switch-off in 1–3 ms)

Suitable for all alpha gearbox series

Preferred coupling series

The technical dimensional sheets for the gearboxes include a preselection of couplings. These are based on the maximum transmittable torque of the gearbox. Standard industrial conditions for the number of cycles (1,000/h) and ambient temperature were adopted.

alpha Basic

Please note that the coupling load is based on the torque the gearbox can transmit and not the torque in your application. For a detailed sizing we recommend using our cymex®5 design software.

You can find detailed information about our couplings at www.wittenstein-alpha.com

Support at each interaction stage

With the WITTENSTEIN alpha service concept, we are also setting new standards in the field of customer support.

DESIGN

We offer the right sizing methodology for every requirement. Whether easy downloading of CAD data, quick and easy calculation, or precise sizing of the drive train.

STARTUP

Our service experts are happy to support you in the installation and startup of complex mechatronic systems, guaranteeing maximum availability of your plant.

SFRVICING

WITTENSTEIN alpha guarantees fast repairs of the highest quality and precision.

In addition, we will provide you with information about various measurements, material analyses, and condition monitoring inspections.

Consultation

- · Personal contact on site
- Competent application calculations and drive sizing

Engineering

Catalog gearboxes:

- · Advanced software tools for accurate calculation, simulation, and analysis of the drive train
- · Optimization of your productivity

Special gearboxes:

- Development and production of customized gearboxes
- · Gearing design and development
- · Inquiries: sondergetriebe@wittenstein.de

See pages 12–15 for more information about the software tools

speedline® delivery

Tel. +49 7931 493-10444

- Delivery of standard product range in 24 or 48 hours ex works*
- · Fast deliveries at short notice

Installation on site

- · Professional installation
- · Optimal application integration
- $\boldsymbol{\cdot}$ Introduction to the operation of the drive
- * Non-binding delivery time depending on part availability

Operating and installation instructions

- · Detail description of how to use the product
- · Installation and motor mounting videos

Pick-up & return service

- · Minimization of downtimes
- · Professional logistics organization
- · Reduction of transport risks

24 h service hotline

Tel. +49 7931 493-12900

Maintenance and inspection

- Documentation regarding condition and expected service life
- · Customer-specific maintenance schedules

cymex® statistics

- · Systematic field data acquisition
- · Reliability calculations (MTBF)

Repairs

- · Repair to nominal condition
- · Immediate response in time-critical situations

Modernization

- · Professional retrofitting
- · Reliable compatibility testing of existing solutions

Individual training without limits

All delivered products are perfectly matched to your application environment and immediately 100% operational.

Our service experts support you in the commissioning of complex mechatronic systems, guaranteeing maximum availability of your plant.

Product training

Greater knowledge enables greater achievement. We will be pleased to share our expert knowledge with you: Profit from our many years of experience and learn more about the product portfolio of WITTENSTEIN alpha.

Installation training

We offer you individual training courses on-site for your system application of selected linear axes as well as professional installation.

Sizing training

Become a design expert! We will provide you with training courses on our design software, adapted to your requirements. Whether for beginners or experts, for occasional or regular users – we adapt our training course to your wishes and requirements.

Service training

Participation in a service training course is a prerequisite for sourcing spare parts at the parts list level. We offer you training courses at our premises or on-site at your plant. Moreover, we regularly host maintenance workshops at which the participants are instructed in safe handling during mounting of the motor to the gearbox as well as the independent replacement of wearing parts and gearbox assemblies.

Global presence. Personal consultation.

No matter where you need us:

A comprehensive sales and service network provides quick availability and competent support worldwide.

24 h service hotline: +49 7931 493-12900

The WITTENSTEIN group -

The company and its fields of business

With approximately 2,900 employees worldwide, WITTENSTEIN SE stands for innovation, precision and excellence in the world of mechatronic drive technology, both nationally and internationally. The group is active in seven innovative fields of business.

Furthermore, WITTENSTEIN SE is represented by some 60 subsidiaries in around 40 countries in all important technology and sales markets worldwide.

Our fields of expertise

- Machine and plant construction
- · Software development
- · Aerospace
- · Automotive & E-mobility
- · Energy

- · Oil & Gas Exploration
- · Medical technology
- Measurement and testing technology

Sizing - Planetary / Bevel gearboxes

The following schematic shows the steps of the sizing of planetary and bevel gearboxes. Please use cymex® - www.wittenstein-cymex.com for a detailed sizing.

Schematic cyclic operation \$5 and continuous operation \$1

 $D_{W, Mot} \le D_{clamping hub}$

The motor shaft must be inserted far enough into the clamping hub.

The motor shaft must protrude far enough into the clamping hub without making contact.

The gearbox should not be damaged when the motor operates at full load, limit the motor current if necessary.

Diagram 1 Standard collective load at output. At input speeds up to rated speed $n_{\rm 1N}$ or thermal speed limit $n_{\rm 1P}$ the temperature of the gearbox will not exceed 90 °C under average ambient conditions.

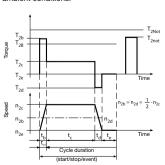

Diagram 2 Large number of cycles combined with short acceleration times may cause the drive train to vibrate. Use the shock factor \mathbf{f}_{a} to include the resulting excess torque

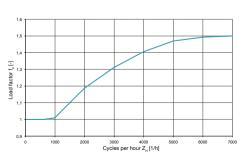

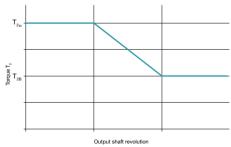

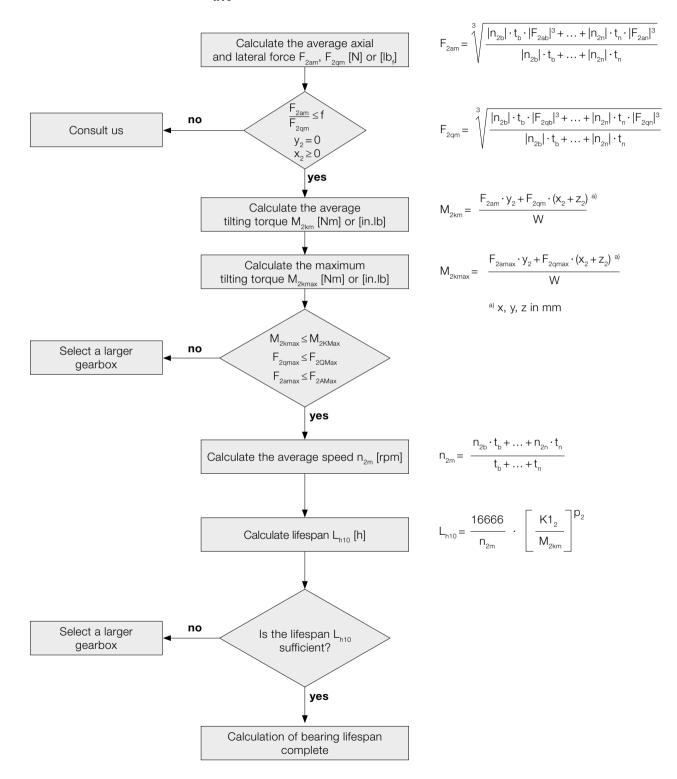

Diagram 3 The transmittable torque $T_{2\alpha,per}$ of the gearbox is dependent on the number of output shaft revolutions. In the lower output shaft revolution range, the fatigue strength range of the toothing can be fully utilized up to the maximum value $T_{2\alpha}$.

Sizing - Planetary / Bevel gearboxes

Please use cymex® - www.wittenstein-cymex.com for a detailed sizing.

Calculation tilting moment caused by the motor $\mathbf{M}_{\mathbf{1kMot}}$ For NPK, NPSK, NPLK, NPRK, NPTK, CPK, and CPSK

Particularly when the motor is installed in a horizontal mounting position (xx/B5) $\,$

Clamping hub diameter	-	mm	11	14	19	28	38
Max. permissible static tilting moment caused by motor	M _{1KMot}	Nm	5.5	7	18	55	130

In horizontal mounting position B5 and symmetrical weight distribution of the motor:

 M_{1kMot} = motor weight [kg] · 4,9 · motor length [m]

Sizing - Worm gearboxes

The following schematic shows the steps of the sizing of worm gearboxes. Please use cymex® - www.wittenstein-cymex.com for a detailed sizing.

A: Simplified sizing for servo motors based on the maximum motor torque: $M_{max} * i \le T_{2\alpha}$

B: Sizing based on the application

Step 1:

Determine the application data

$$T_{2b} =$$
_____[Nm] $n_{1n} =$ _____[rpm]

Step 2:

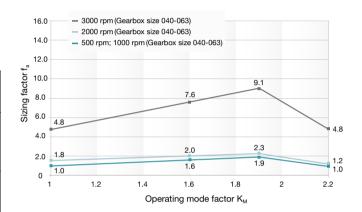

Determine the operating mode factor $K_{M} = 1$

Typical applications	Cycle	Torque characteristic	Operating mode factor K _M						
Format changing, e.g. in packaging machines, drives for processing equipment, actuators etc.	S5 operation: Low duty cycle Small number of cycles Low dynamics	T _{2D} t ^z t	1.0						
Tool changers with low dynamics, pick & place gantry axes, tire building machines etc.	S5 operation: Medium duty cycle Small number of cycles Medium dynamics	T _{2b} t ^z t	1.6						
Linear axes in plasma, laser or water jet cutters, portals, tool changers with high dynamics	S5 operation: Medium duty cycle Medium number of cycles High dynamics	T _{2b}	1.9						
Roller drives in printing presses, star drives in rackers etc.	S1 operation: High duty cycle	T _{2b} t ^z t	2.2						
cymex® 5 also allows sizing calculations for other applications / cycles!									

Step 5: Quick selection of the technical data

Step 3:

Determine the sizing factor f_a with the operating mode factor K_M $f_a =$

Step 4:

Compare the equivalent application torque with the maximum gearbox T_{2a} (see table, Step 5)

$$\begin{split} & T_{2_eq} = f_a * T_{2b} \le T_{2\alpha} \\ & T_{2_eq} = \underline{\hspace{1cm}} * \underline{\hspace{1cm}} \le T_{2\alpha} \\ & T_{2_eq} = \underline{\hspace{1cm}} [Nm] \le \underline{\hspace{1cm}} [Nm] \end{split}$$

We recommend using a vent screw for duty cycles \ge 60 %, longer than 20 min (S1 operation) and n1N \ge 3000 rpm.

				V-Drive Basic		V-Drive Value			
			040	050	063	040	050	063	
Ratio	i			7-40		4-400			
Max. torque ^{a)} (at n ₁ = 500 rpm)	T ₂₀	Nm	68-82	116-140	265-301	74-98	150-167	303-365	
Max. input speed	n _{1max}	rpm	6000	6000	4500	6000	6000	4500	
Max. lateral force	F _{2QMax}	N	1000 / 2400 ^{b)}	1200 / 3800 ^{b)}	2000 / 6000 ^{b)}	2400	3800	6000	
Operating noise	L _{PA}	dB(A)	≤ 54	≤ 62	≤ 64	≤ 54	≤ 62	≤ 64	
Max. backlash	j_t	arcmin	≤ 15	≤ 15	≤ 15	≤ 6	≤ 6	≤ 6	
Service life	L,	h	> 15000	> 15000	> 15000	> 20000	> 20000	> 20000	

a) The maximum torques depend on the ratio

b) Refers to center of the output shaft or flange. First value for MF-version (Standard), second value for MT-version (reinforced bearing)

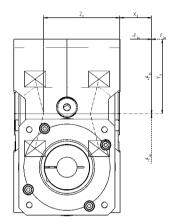

Account must be taken of the lateral and axial forces at the output:

Please also carry out steps 6 and 7 if forces are present at the output (e.g. if timing belt pulleys, pinions or levers are mounted there).

Step 6 (if external forces are present):

Determine the forces acting on the output and check the boundary conditions

Lateral force $F_{2q} =$ ____[N]
Lateral force distance $x_2 =$ ___[mm]
Axial force $F_{2a} =$ ___[N]
Axial force distance $y_2 =$ ___[mm]
(required if F_{2a} is present)

Conditions if axial force F_{2a} is present:

1.
$$F_{2a} \le 0.25 * F_{2q} \Rightarrow (___ \le 0.25 * ___)$$

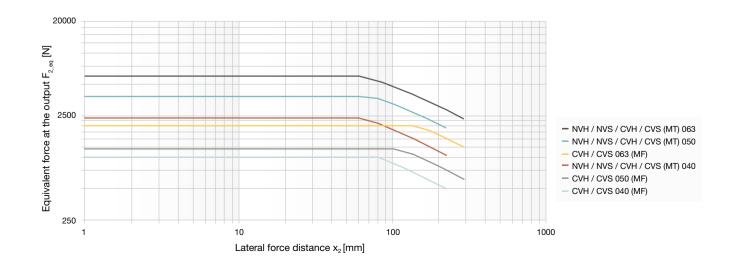

- 2. $y_2 \le x_2 \Rightarrow ($ _____ \le ____)
- ☐ Met ☐ Not met: Sizing with cymex® 5

Step 7:

Determine the maximum equivalent force acting on the output $F_{2 \text{ eq}}$

 $F_{2,eq} = F_{2q} + 0.25 * F_{2a} \le F_{2QMax}$ (F_{2QMax} can be determined from the diagram below) $F_{2,eq} = \underline{\qquad} + 0.25 * \underline{\qquad} \le \underline{\qquad}$

$$\mathbf{F}_{2_eq} = \underline{\hspace{1cm}} [\mathbf{N}] \leq \underline{\hspace{1cm}} [\mathbf{N}]$$
 \square Met \square Not met: Sizing with cymex® 5

Glossary - the alphabet

Acceleration torque (T_{2B})

The acceleration torque T_{2B} is the maximum permissible torque that can briefly be transmitted at the output by the gearhead after \leq 1000/h cycles. For > 1000/h cycles, the \rightarrow **Shock factor** must be taken into account. T_{2B} is the limiting parameter in cyclic operation.

Adapter plate

WITTENSTEIN alpha uses a system of standardized adapter plates to connect the motor and the gearbox, making it possible to mount a WITTENSTEIN alpha gearbox to any desired motor without difficulty.

Angular minute

A degree is subdivided into 60 angular minutes (= 60 arcmin = 60').

Example:

If the torsional backlash is $j_{\rm t}=1$ arcmin, the output can be turned 1/60°. The repercussions for the application are determined by the arc length:

 $b = 2 \cdot \pi \cdot r \cdot \alpha^{\circ} / 360^{\circ}$.

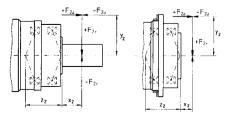

Example:

A pinion with a radius r = 50 mm mounted on a gearbox with torsional backlash $j_1 = 3$ arcmin can be turned b = 0.04 mm.

Axial force (F_{2AMax})

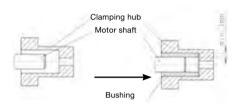

The axial force acting on a gearbox runs parallel to its output shaft or perpendicular to its output shaft. It may be applied with axial offset via a lever arm y_2 under certain circumstances, in which case it also generates a bending moment. If the axial force exceeds the permissible catalog values (max. axial force F_{2AMax}), additional design features (e.g. axial bearings) must be implemented to absorb these forces.

Example with output shaft and flange:

Bushing

If the motor shaft diameter is smaller than the → clamping hub, a bushing is used to compensate the difference in diameter. The bushing must have a minimum thickness of 1 mm and a motor shaft diameter of 2 mm.

CAD POINT

Performance data, dimension sheets and CAD data for all types of gearbox can be found online in our CAD POINT together with comprehensive documentation of the selection.

(www.wittenstein-cad-point.com)

Clamping hub

The clamping hub ensures a frictional connection between the motor shaft and gearbox. A → bushing is used as the connecting element if the motor shaft diameter is smaller than that of the clamping hub. Optionally, a positive connection via a parallel key is also possible.

Continuous operation (S1)

Continuous operation is defined by the → duty cycle. If the duty cycle is greater than 60% and / or longer than 20 minutes, this qualifies as continuous operation. → Operating modes

Cyclic operation (S5)

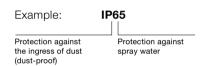

Cyclic operation is defined via the → duty cycle. If the duty cycle is less than 60 % and shorter than 20 minutes, it qualifies as cyclic operation (→ operating modes).

cymex®

cymex® is the calculation software developed by our company for dimensioning complete drive trains. The software enables the precise simulation of motion and load variables. The software is available for download from our website (www.wittenstein-cymex.com). We can also provide training to enable you to make full use of all the possibilities provided by the software.

Degree of protection (IP)

The various degrees of protection are defined in DIN EN 60529 "Degrees of protection offered by enclosure (IP code)". The IP degree of protection (International Protection) is represented by two digits. The first digit indicates the protection against the ingress of impurities and the second the protection against the ingress of water.

Delivery of speedline®

If necessary, you can receive delivery of standard series in 24 or 48 hours ex works. Outstanding flexibility for fast deliveries at short notice.

Duty cycle (DC)

The cycle determines the duty cycle DC. The times for acceleration $(t_{\rm b})$, constant travel if applicable $(t_{\rm c})$ and deceleration $(t_{\rm d})$ combined yield the duty cycle in minutes. The duty cycle is expressed as a percentage with inclusion of the pause time $t_{\rm e}$.

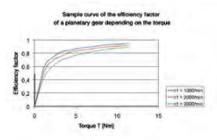

DC [%] =
$$\frac{t_b + t_c + t_d}{t_b + t_c + t_d + t_e} - 100 \frac{\text{Motion duration}}{\text{Cycle duration}}$$

DC [min] = $t_{\rm h} + t_{\rm c} + t_{\rm d}$

Efficiency (η)

Efficiency [%] η is the ratio of output power to input power. Power lost through friction reduces efficiency to less than 1 or 100%.

$$\eta = P_{\text{off}}/P_{\text{on}} = (P_{\text{on}} - P_{\text{loss}})/P_{\text{on}}$$

WITTENSTEIN alpha always measures the efficiency of a gearbox during operation at full load. If the input power or torque are lower, the efficiency rating is also lower due to the constant noload torque. Power losses do not increase as a result. A lower efficiency is also expected at high speeds (see illustration).

Emergency stop torque (T_{2Not})

The Emergency stop torque $T_{\rm 2Not}$ is the maximum permissible torque at the gearbox output and must not be reached more than 1000 times during the life of the gearbox. It must never be exceeded!

Food-grade lubrication (F)

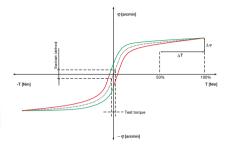

These products are designed with foodgrade lubrication and can therefore be used in the food industry. Note the reduced torques compared to the standard products. (V-Drive excluded). The exact torques can be found in cymex® 5 or CAD POINT.

HIGH TORQUE (MA)

WITTENSTEIN alpha gearboxes are also available in a HIGH TORQUE version. These gearboxes are particularly suited to applications requiring extremely high torques and maximum stiffness.

Hysteresis curve

The hysteresis is measured to determine the torsional rigidity of a gearbox. The result of this measurement is known as the hysteresis curve.

If the input shaft is locked, the gearbox is continuously loaded and relieved at the output in both directions up to a defined torque. The torsional angle is plotted against the torque. This vields a closed curve from which the → torsional backlash and →torsional rigidity can be calculated.

Jerk (i)

Jerk is derived from acceleration and is defined as the change in acceleration within a unit of time. The term impact is used if the acceleration curve changes abruptly and the jerk is infinitely large.

Lateral force ($F_{\rm 2QMax}$) The max. lateral force $F_{\rm 2QMax}$ [Nm] is the force component acting at right angles to the output shaft or parallel to the output flange. It acts perpendicular to the → axial force and can assume an axial distance of x_0 in relation to the shaft nut or shaft flange, which acts as a lever arm. The lateral force produces a bending moment (see also → axial force).

Gearboxes of the CP series with size 005 and 015 may be used with higher lateral forces if the T_{2B} is reduced according to the tables below.

CP 005	1-stage				2-stage						
Ratio	4	5	7	10	16	20	25	35	50	70	100
T ₂₀	10.5	11.5	11.5	10.5	10.5	10.5	11.5	11.5	11.5	11.5	10.5
F _{2QMax}	200			200							

CP 015		1-stage					- :	2-stage	•		
Ratio	4	5	7	10	16	20	25	35	50	70	100
T ₂₀	32	32	32	29	32	32	32	32	32	32	29
F _{2QMax}		650						650			

Mass inertia ratio (λ = Lambda)

The mass inertia ratio λ is the ratio of external inertia (application side) to internal inertia (motor and gearbox side). It is an important parameter determining the controllability of an application. Accurate control of dynamic processes becomes more difficult with differing mass moments of inertia and as λ becomes greater. WITTENSTEIN alpha recommends that a guideline value of λ <5 is maintained. A gearbox reduces the external mass moment of inertia by a factor of 1/i2.

$$\lambda = \frac{J'_{extern}}{J_{intern}}$$

J reduced externally at input: $J'_{\text{external}} = J_{\text{external}} / i^2$

Simple applications ≤ 10 Dynamic applications ≤ 5 Highly dynamic applications ≤ 1

Mass moment of inertia (J)

The mass moment of inertia J [kg/cm²] is a measurement of the effort applied by an object to maintain its momentary condition (at rest or moving).

Mesh frequency (f_{\cdot})

The mesh frequency may cause problems regarding vibrations in an application, especially if the excitation frequency corresponds to a intrinsic frequency of the application. The mesh frequency can be calculated for planetary gearboxes from WITTENSTEIN alpha (exception: gearboxes with ratio i = 8) using the formula $f_7 = 1.8 \cdot n_2$ [rpm].

Glossary - the alphabet

No-load running torque (T_{012})

The no-load running torque T_{012} the torque which must be applied to a gearbox in order to overcome the internal friction; it is therefore considered lost torque. The values specified in the catalog are calculated by WITTENSTEIN alpha at a speed of $n_1 = 3000$ rpm and an ambient and gearbox temperature of 20°C.

$$\begin{array}{cccc} T_{\rm 012} \hbox{:} & 0 & & 1 {\:\rightarrow\:} 2 \\ & & \text{without} & & \text{from input side towards} \\ & & \text{load} & & \text{output side} \end{array}$$

Idling torques decrease during operation.

NSF

Lubricants certified as grade H1 by the NSF (National Sanitation Foundation) can be used in the food sector where occasional unavoidable contact with food cannot be excluded.

Operating modes

(continuous operation S1 and cyclic operation **S5**)

Gearboxes are selected depending on whether the motion profile is characterized by frequent acceleration and deceleration phases in → cvclic operation (S5) as well as pauses, or whether it is designed for → continuous operation (S1), i.e. with long phases of constant motion.

Operating noise ($L_{\rm PA}$) The gear ratio and speed affect the noise level. As a general rule: A higher speed means a higher noise level, while a higher ratio means a lower noise level. The values specified in our catalog are based on a reference ratio and speed. The reference speed is either $n_1 = 3000 \text{ rpm or } n_1 = 2000 \text{ rpm depending}$ on the size of the gearbox. You can find ratio-specific values in cymex® www.wittenstein-cymex.com.

Output shaft revolution (f.)

Factor f., determines the number of cycles for the required gearbox service life. It describes the number of revolutions at the output used to assess the torque permitted at the output.

Positioning accuracy

The positioning accuracy is determined by the angular deviation from a setpoint and equals the sum of the torsional angles due to load → (torsional rigidity and → torsional backlash) and kinetics → (synchronization error) occurring simultaneously in practise.

Ratio (i)

The gear ratio i indicates the factor by which the gearbox transforms the three relevant parameters of motion (speed, torque and mass moment of inertia). The factor is a result of the geometry of the gearing elements (Example: i = 10).

$$n_1 = 3000 \text{ rpm}$$
 ;; $T_2 = 200 \text{ Nm}$
 $T_1 = 20 \text{ Nm}$ $n_2 = 300 \text{ rpm}$
 $J_1 = 0,10 \text{ kgm}^2$ $J_2 = 10 \text{ kgm}^2$ (Application)

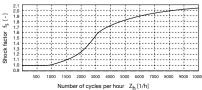

Safety note

For applications with special safety requirements (e.g. vertical axes, clamped drives), we recommend exclusive use of our Premium and Advanced products (excluding V-Drive).

Shock factor (f_s)

The maximum permissible acceleration torque during cyclic operation specified in the catalog applies for a cycle rate less than 1000/h. Higher cycle rates combined with short acceleration times can cause vibrations in the drive train. Use the shock factor f to include the resulting excess torque values in calculations. The shock factor f_s can be determined with reference to the curve. This calculated value is multiplied by the actual acceleration torque ${\rm T_{2b}}$ and then compared with the maximum permissible acceleration torque T_{2B} .

$$(T_{2b} \cdot f_s = T_{2b}, f_s < T_{2B})^T$$

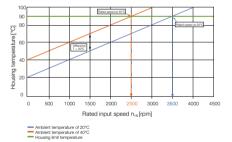

SIZING ASSISTANT

The online SIZING ASSISTANT from WITTENSTEIN alpha allows the efficient selection of a gearbox in seconds. You can use various motor or application entry options to select the right gearbox for your application in seconds (www.sizing-assistant.de).

Speed (n)

Two speeds are of relevance when dimensioning a gearbox: the maximum speed and the thermal speed limit at the input. The maximum permissible speed $n_{\rm 1Max}$ must not be exceeded because it serves as the basis for dimensioning → cyclic operation. The nominal speed n_{1N} must not be exceeded in → continuous operation. The thermal speed limit n_{1T} at an ambient temperature of 20°C, is determined by the maximum gearbox temperature of T = 90°C at no-load. As can be seen in the diagram below, the temperature limit is reached more quickly in the presence of an elevated outside temperature.

In other words: the nominal input speed must be reduced if the ambient temperature is high. The values applicable to your gearbox are available from WITTENSTEIN alpha on request.

Synchronization **Synchronization**

Synchronization refers to the measurable transmission error between the input and output during one revolution of the output shaft.

Technical data

You can download further technical data relating to the entire product portfolio from our website.

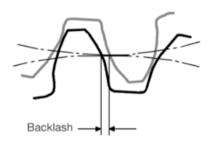

Tilting rigidity

The tilting rigidity C_{2K} [Nm/arcmin] of the gearbox consists of the bending stiffness of the output or pinion shaft and the stiffness of the output bearing. It is defined as the quotient of tilting moment M_{2K} [Nm] and tilting angle ϕ [arcmin] $(C_{2K}^{-1} = M_{2K}/\boldsymbol{\phi}).$

Tilting torque (M_{2K}) The tilting torque M_{2K} is a result of the \rightarrow axial forces and \rightarrow lateral forces applied and their respective points of application in relation to the inner radial bearing on the output side.

Torsional backlash (j,)

Torsional backlash $j_{\scriptscriptstyle t}$ [arcmin] is defined as the max. torsional angle of the output shaft at a defined test torque and a blocked input.

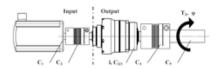

Torsional backlash is measured with the input shaft locked.

The output is then loaded with a defined test torque in order to overcome the internal gearbox friction. The main factor affecting torsional backlash is the face clearance between the gear teeth. The low torsional backlash of WITTENSTEIN alpha gearboxes is due to their high manufacturing accuracy and the specific combination of gear wheels.

Torsional rigidity (C_{t21})

Torsional rigidity [Nm/arcmin] C_{121} is defined as the quotient of applied torque and resulting torsion angle ($C_{t21} = \Delta T/\Delta \Phi$). It shows the torque required to turn the output shaft by one angular minute. The torsional rigidity can be determined from the - hysteresis curve.

Torsional rigidity C, angle of torsion ϕ

Reduce all torsional rigidity values at the output:

$$C_{(n),out} = C_{(n),in} * i^2$$

with *i* = Gearbox ratio [-] $C_{(n)}$ = Individual rigidity values [Nm/arcmin]

Series connection of torsional rigidity values

$$1/C_{\text{tot}} = 1/C_{1,\text{out}} + 1/C_{2,\text{out}} + ... + 1/C_{(n)}$$

Angle of torsion ϕ [arcmin]

$$\Phi = T_2 * 1/C_{tot}$$

with T_2 = output torque [Nm]

Torque (M)

The torque is the actual driving force of a rotary motion. The force and lever arm combine to produce the torque that acts around the axis of rotation. $M = F \cdot I$

Torque ($T_{2\alpha}$) $T_{2\alpha}$ represents the maximum torque transmitted by the gearbox. This value may decrease depending on the applicationspecific conditions and the precise evaluation of the movement profile.

Glossary - Formulae

Formulae

Torque [Nm]	$T = J \cdot \alpha$	$J = \text{Mass moment of inertia [kgm}^2]$ $\alpha = \text{Angular acceleration [1/s}^2]$
Torque [Nm]	T=F·I	F = Force [N] I = Lever, length [m]
Acceleration force [N]	$F_b = m \cdot a$	m = Mass [kg] a = Linear acceleration [m/s²]
Frictional force [N]	$F_{\text{Reib}} = m \cdot g \cdot \mu$	g = Acceleration due to gravity 9.81 m/s ² μ = Coefficient of friction
Angular speed [1/s]	$\omega = 2 \cdot \pi \cdot n / 60$	n = Speed [U/min] $\pi = \text{PI} = 3.14$
Linear speed [m/s]	$V = \omega \cdot r$	r = Radius [m]
Linear speed [m/s] (spindle)	$V_{\rm sp} = \omega \cdot h / (2 \cdot \pi)$	h = Screw pitch [m]
Linear acceleration [m/s²]	$a = v/t_b$	t - Appeleration time [c]
Angular acceleration [1/s²]	$\alpha = \omega / t_{\rm b}$	t _b = Acceleration time [s]
Pinion path [mm]	$s = m_{n} \cdot z \cdot \pi / \cos \beta$	m_n = Normal module [mm] z = Number of teeth [-] β = Helix angle [°]

Conversion table

1 mm	= 0.039 in
1 Nm	= 8.85 in.lb
1 kgcm²	= 8.85 x 10 ⁻⁴ in.lb.s ²
1 N	= 0.225 lb _f
1 kg	= 2.21 lb _m

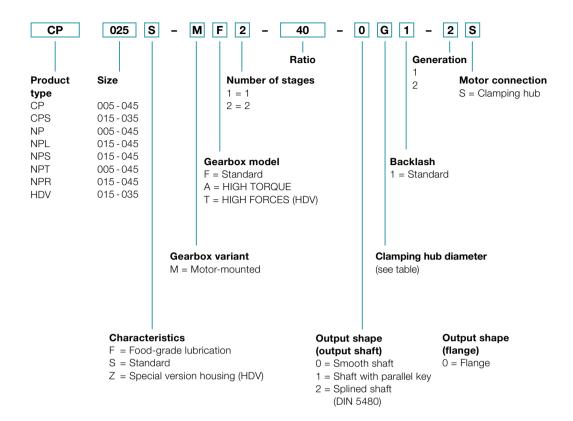

Symbol

Symbol	Unit	Designation
С	Nm/arcmin	Stiffness
ED	%, min	Duty cycle
F	N	Force
f _s	-	Load factor
$f_{\rm e}$	_	Factor for duty cycle
i	_	Ratio
j	arcmin	Backlash
J	kgm²	Mass moment of inertia
K1	Nm	Factor for bearing calculation
L	h	Service life
L _{PA}	dB(A)	Operating noise
m	kg	Mass
М	Nm	Torque
n	rpm	Speed
p	_	Exponent for bearing calculation
η	%	Efficiency
t	S	Time
Т	Nm	Torque
V	m/min	Linear speed
Z	1/h	Number of cycles

Index

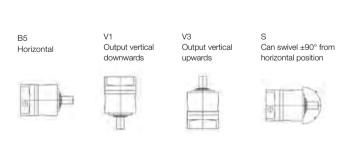

Index	Designation
Capital letter	Permissible values
Small letter	Actual values
1	Input
2	Output
A/a	Axial
B/b	Acceleration
С	Constant
d	Deceleration
е	Pause
h	Hours
K/k	Tilting
m	Mean
Max/max	Maximum
Mot	Motor
N	Nominal
Not/not	Emergency stop
0	No load
Q/q	Lateral
t	Torsional
Т	Tangential

Ordering code - planetary gearboxes

Mounting positions and clamping hub diameters

Clamping hub diameter (see technical data sheet for possible diameters)

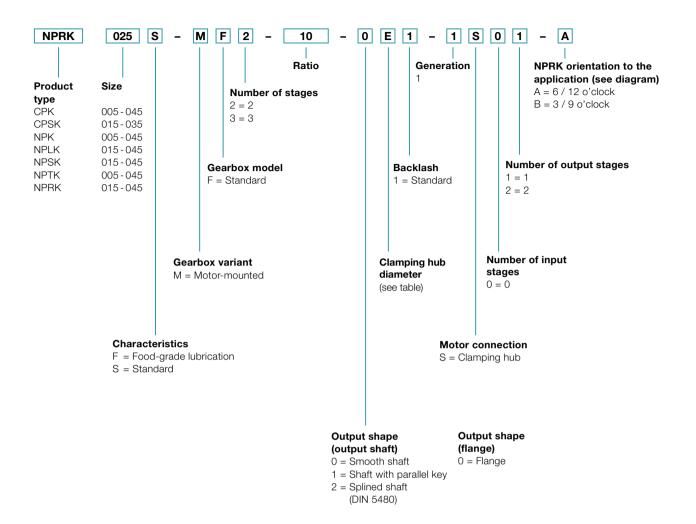

Code letter	mm
Z	8
А	9
В	11
С	14
D	16

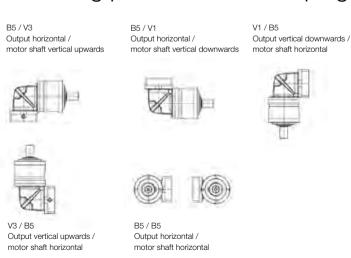

mm	Code letter	mm
8	E	19
9	G	24
11	Н	28
14	I	32
16	К	38

For information purposes only – not required when placing orders! Please contact WITTENSTEIN alpha for deviating mounting positions.

Ordering code - bevel gearboxes

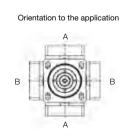

Mounting positions and clamping hub diameters

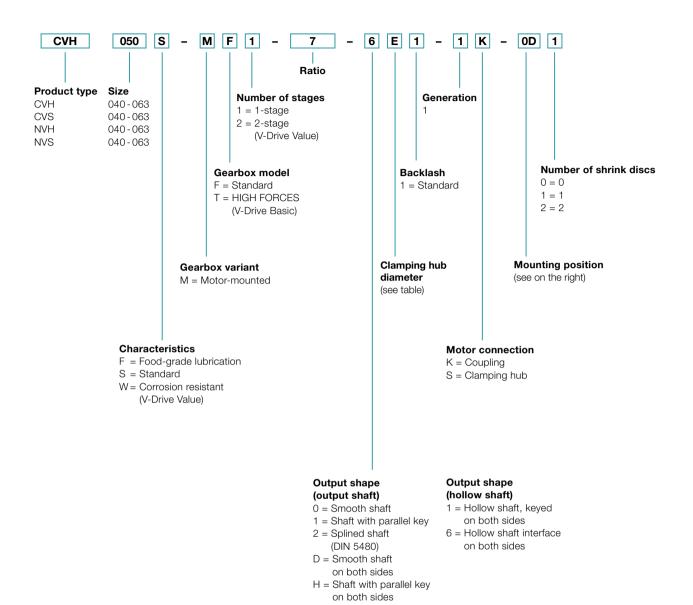

Clamping hub diameter (see technical data sheet for possible diameters)

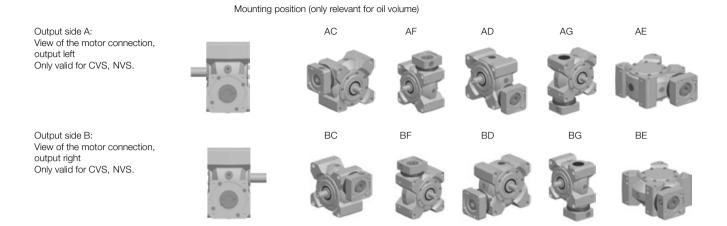

Code letter	mm
В	11
С	14
Е	19
Н	28
К	38

Ordering code - worm gearboxes

Mounting positions and clamping hub diameters

With output shaft or hollow shaft on both sides, A or B in the mounting position is replaced by a 0 (zero).

Clamping hub diameter (see technical data sheet for possible diameters)

Code letter	mm
С	14
Е	19
G	24
Н	28

Intermediate sizes possible using bushings with a minimum wall thickness of 1 mm.

WITTENSTEIN alpha - Intelligent drive systems

www.wittenstein-us.com

The entire world of drive technology – Catalogs available on request or online at www.wittenstein-us.com/catalogs

alpha Advanced Line. Maximum power density and outstanding positioning accuracy for complex applications.

alpha Basic Line & alpha Value Line. Reliable, flexible and economical solutions for a wide range of applications.

alpha Linear Systems. Precise, dynamic system solutions for every requirement.

alpha Mechatronic Systems. Energy-efficient, versatile and flexible mechatronic drive systems.
